

LISTING OF THE CLAIMS

The following listing of claims will replace all prior versions and listings of claims in the application.

LISTING OF CLAIMS

1- 74. (Cancelled)

75. (Previously Presented) The system according to Claim 108, wherein said diagnostic device determines an operating time for said compressor and an idle time for said compressor.

76. (Previously Presented) The system according to Claim 108, wherein said diagnostic device determines a length of time said motor is outside of specified operating parameters.

77. (Previously Presented) The system according to Claim 108, further comprising an electrical plug, said diagnostic device being integrated into said electrical plug.

78. (Previously Presented) The system according to Claim 108, further comprising a contactor providing a demand signal, said compressor operating in said ON condition in response to said demand signal.

79. (Previously Presented) The system according to Claim 78, wherein said diagnostic device is integrated into said contactor.

80. (Previously Presented) The system of Claim 108, further comprising an intelligent device in communication with said diagnostic device and operable to indicate said fault condition.

81. (Previously Presented) The system according to Claim 80, wherein said intelligent device receives diagnostic information from said diagnostic device.

82. (Previously Presented) The system according to Claim 108, further comprising:

a sensor in communication with said diagnostic device and operable to monitor an operating characteristic of the system wherein said diagnostic device receives said operating characteristic from said sensor and is operable to shut down said compressor based on said operating characteristic.

83. (Previously Presented) The system according to Claim 82, wherein said sensor is a pressure sensor operable to monitor a discharge pressure of said compressor.

84. (Previously Presented) The system according to Claim 82, wherein said sensor is a temperature sensor operable to monitor ambient temperature.

85. (Previously Presented) The system according to Claim 82, wherein said sensor is a voltage sensor operable to monitor electrical voltage being supplied to said motor.

86. (Previously Presented) The system according to Claim 82, wherein said diagnostic device uses a demand signal in conjunction with said sensor to monitor said operating characteristic.

87. (Previously Presented) The system according to Claim 82, wherein said sensor is a current sensor operable to monitor electrical current supplied to said motor.

88. (Previously Presented) The system according to Claim 87, wherein said diagnostic device determines said status of said motor protector based on input from said current sensor.

89. (Previously Presented) The system of Claim 108, wherein said fault condition is a compressor fault.

90. (Previously Presented) The system of Claim 108, wherein said fault condition is a system fault.

91. (Cancelled)

92. (Previously Presented) The system according to Claim 109, wherein said diagnostic device determines an operating time for said compressor and an idle time for said compressor.

93. (Previously Presented) The system according to Claim 109, wherein said diagnostic device determines a length of time said motor is outside of specified operating parameters.

94. (Previously Presented) The system according to Claim 109, further comprising an electrical plug, said diagnostic device being integrated into said electrical plug.

95. (Previously Presented) The system according to Claim 109, further comprising a contactor providing a demand signal, said compressor operating in said ON condition in response to said demand signal.

96. (Previously Presented) The system according to Claim 95, wherein said diagnostic device is integrated into said contactor.

97. (Previously Presented) The system of Claim 109, further comprising an intelligent device in communication with said diagnostic device and operable to indicate said fault condition.

98. (Previously Presented) The system according to Claim 97, wherein said intelligent device receives diagnostic information from said diagnostic device.

99. (Previously Presented) The system according to Claim 109, further comprising:

a sensor in communication with said diagnostic device and operable to monitor an operating characteristic of the system wherein said diagnostic device receives said operating characteristic from said sensor and is operable to shut down said compressor based on said operating characteristic.

100. (Previously Presented) The system according to Claim 99, wherein said sensor is a pressure sensor operable to monitor a discharge pressure of said compressor.

101. (Previously Presented) The system according to Claim 99, wherein said sensor is a temperature sensor operable to monitor ambient temperature.

102. (Previously Presented) The system according to Claim 99, wherein said sensor is a voltage sensor operable to monitor electrical voltage being supplied to said motor.

103. (Previously Presented) The system according to Claim 99, wherein said diagnostic device uses a demand signal in conjunction with said sensor to monitor said operating characteristic.

104. (Previously Presented) The system according to Claim 99, wherein said sensor is a current sensor operable to monitor electrical current supplied to said motor.

105. (Previously Presented) The system according to Claim 104, wherein said diagnostic device determines said status of said motor protector based on input from said current sensor.

106. (Previously Presented) The system of Claim 109, wherein said fault condition is a compressor fault.

107. (Previously Presented) The system of Claim 109, wherein said fault condition is a system fault.

108. (Previously Presented) A system comprising:
a compressor including a motor operable to power said compressor to an ON condition;
a motor protector operable in a tripped condition to restrict power to said motor in response to motor operating parameters;

a diagnostic device operable to diagnose a fault condition based on a moving window time average of said compressor operating in said ON condition when said motor protector is in said tripped condition.

109. (Previously Presented) A system comprising:

a compressor including a motor operable to power said compressor to an ON condition;

a motor protector operable in a tripped condition to restrict power to said motor in response to motor operating parameters;

a diagnostic device operable to diagnose a fault condition when said motor protector is in said tripped condition based on a moving window time average of said compressor operating in said ON condition.
